*Based on CDC's current statistics reporting a prevalence of people living with TBI at 1.03% of the total US population of 307,006,550.

Nationwide CDC estimates include only people living with TBI-related disability who were discharged from the hospital. It does not include people with long-term problems who were treated and released from emergency departments or who received no medical care. Service members injured outside of the US and those treated in military healthcare facilities here in the US also are not included.
